Abstract

The Cauchon algorithm, see, e.g., [1], has been applied to totally nonnegative matrices in order to characterize these matrices [2] and their subclasses [3], to recognize totally nonnegative matrix cells [4], and to derive determinantal criteria for this class of matrices [5]. In this talk we report on some recent applications of this algorithm, e.g., to the study the invariance of total nonnegativity under element-wise perturbation and the subdirect sum of two totally nonnegative matrices [6], to the investigation of the interval property of sign regular matrices, and to the determination of the rank of an arbitrary matrix [7].

Keywords

Cauchon algorithm, totally nonnegative matrix, subdirect sum, interval property, rank.
